Bovie Freezpoint Cryosurgery Device | CRY16

Stock Photo – Options May Vary

FACTORY NEW

Bovie Freezpoint Cryosurgery Device: CRY16. Cryosurgery is a popular treatment for simple skin lesions that physicians and veterinarians can perform in the office.

The Bovie® Freezpoint™ is a safe, simple, and exceptionally cold device that delivers an improved, low-cost per-procedure cryosurgical option compared to other available products. Additional Features: The Freezpoint device application can reach – 89° C and is up to 62% colder than common multi-use disposable systems.

The colder temperature may provide a more effective application than the higher temperature produced by applicator-based systems. The slim tip design aids in clearly visualizing the lesion for precise delivery of non-flammable nitrous oxide therapy, with reduced tissue damage to surrounding healthy skin.
